FSM Design Example-2

A vending machine will open the door to let out a pack of gum if it receives 15 cents or more in denominations of 5 (Dime) and 10 (Nickel) cents. Consider one input at a time. No return.

Input Sequence:

1. 3 Dimes(15)
2. 2 Dimes & Nickel(20)
3. Dime, Nickle(15)
4. Nickle, Dime(15)
5. 2 Nickles (20)

State Assignment

- Some state assignments are better than others.
- The state assignment influences the complexity of the state machine.
 - The combinational logic required in the state machine design is dependent on the state assignment.
- Types of state assignment
 - Binary encoding
 - Gray-code encoding
 - One-hot encoding

Example

Design a FSM that detects a sequence of two or more consecutive ones on an input bit stream.

The FSM should output a 1 when the sequence is detected, and a 0 otherwise.

Input: 0 1 1 1 0 1 0 1 1 0 1 1 1 0 1 ...

Output: 0 0 1 1 0 0 0 0 1 0 0 1 1 0 0 ...

Characteristic Equation: $D = Q^+$

Example: State Assignment 1

		$Q_A Q_B$			
		00	01	11	10
D_A	W	0	0	d	0
	1	0	1	d	1

$$D_A = W \cdot Q_B + W \cdot Q_A$$

$$D_A = W \cdot (Q_A + Q_B)$$

		$Q_A Q_B$			
		00	01	11	10
D_B	W	0	0	d	0
	1	1	0	d	0

$$D_B = W \cdot \overline{Q_A} \cdot \overline{Q_B}$$

		Q_A

Z	Q_B	0	1
	1	0	d

$$Z = Q_A$$

Example: State Assignment 1

Example: State Assignment 2

Gray code consists of a sequence where only one bit changes between one value and the next. In addition to also using the minimum number of bits, this encoding minimizes dynamic power consumption if the sequence of states is followed optimally.

Example: State Assignment 2

n-bit Gray Code

Present State			Next State						Output
			w = 0			w = 1			
	Q _A	Q _B		Q _A ⁺	Q _B ⁺		Q _A ⁺	Q _B ⁺	z
S ₀	0	0	S ₀	0	0	S ₁	0	1	0
S ₁	0	1	S ₀	0	0	S ₂	1	1	0
S ₂	1	1	S ₀	0	0	S ₂	1	1	1
	1	0		d	d		d	d	d

Using Gray-code Encoding

Example: State Assignment 2

Gray Code

Binary Code

Example: State Assignment 3

One-Hot coding

- Encode n states using n flip-flops.
- Assign a single “1” for each state. Example: 0001 0010 0100 1000.
- Propagate a single “1” from one flip-flop to the next .All other flip-flop outputs are “0”

Example: State Assignment 3

Present State				Next State							
				w = 0				w = 1			
	Q_A	Q_B	Q_C		Q_A^+	Q_B^+	Q_C^+		Q_A^+	Q_B^+	Q_C^+
S_0	0	0	1	S_0	0	0	1	S_1	0	1	0
S_1	0	1	0	S_0	0	0	1	S_2	1	0	0
S_2	1	0	0	S_0	0	0	1	S_2	1	0	0

Using One-hot Encoding
for the State Assignment

For each state only one flip-flop is set to 1.
The remaining combination of state variables are not used.

Characteristic Equation: $D = Q^+$

Example: State Assignment 3

D_A

$Q_B Q_C$	00	01	11	10
$w Q_A$				
00	d	0	d	0
01	0	d	d	d
11	1	d	d	d
10	d	0	d	1

$$D_A = w \cdot \bar{Q}_C$$

D_B

$Q_B Q_C$	00	01	11	10
$w Q_A$				
00	d	0	d	0
01	0	d	d	d
11	0	d	d	d
10	d	1	d	0

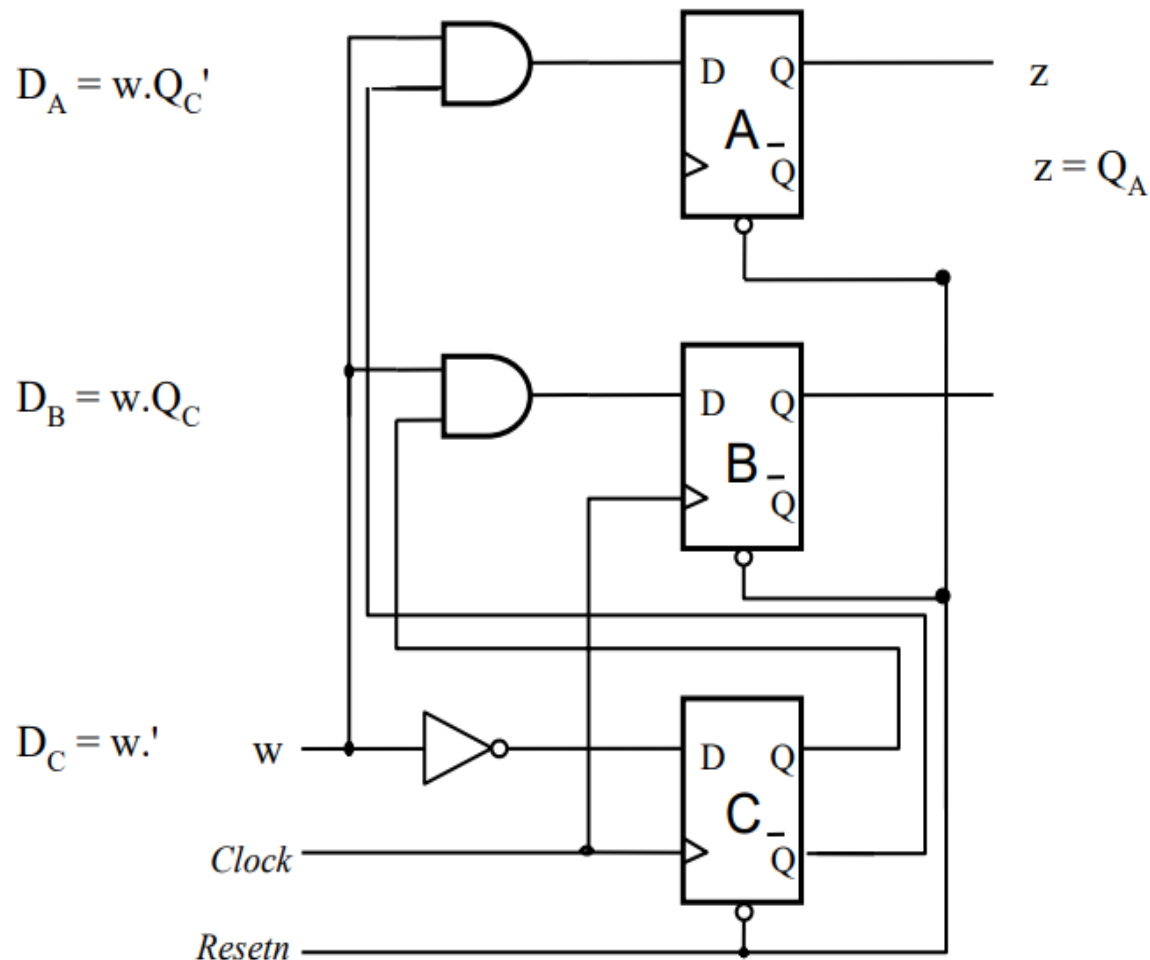

$$D_B = w \cdot Q_C$$

D_C

$Q_B Q_C$	00	01	11	10
$w Q_A$				
00	d	1	d	1
01	1	d	d	d
11	0	d	d	d
10	d	0	d	0

$$D_C = \bar{w}$$

Example: State Assignment 3

- This may not seem very efficient at first because of the number of bits used, and the excessive number of invalid states.
- However, one-hot encoding is very good at simplifying the stimulus logic for the flip flops because there's no need to decode the states. The bits are the states.
